

Fictionalized Data Table — Derived Directly From PMID 37931033 Figure 1A/1D

A renamed, 1:1 mapping of the real data in PMIDS/PMID 37931033/figure1_data_table.md (Tables 1 and 2). No effect/no-effect pattern was invented — every cell reproduces the real result for its mapped real condition/cell line. Only the numeric percentage and death-marker values (needed for the benchmark's quantitative threshold question) are illustrative additions layered on top of the real categorical pattern.

Mapping key

Real (PMID 37931033)	Fictional (benchmark)
AKT1	K1
AKT2	K2
AKT3	K3
A375	L1
HT144	L2
SK-MEL28	L3
WM793 (Pten-/-)	L4
MTG001	L5
MTG004	L6

Table 1 (fictionalized) — Proliferation, derived from real Table 1

Condition	L1	L2	L3	L4	L5	L6
K1 alone	No effect	No effect	No effect	No effect	No effect	No effect
K2 alone	No effect	No effect	No effect	No effect	No effect	No effect
K3 alone	No effect	No effect	No effect	No effect	No effect	No effect
K1+K2 (K3 intact)	No effect	No effect	No effect	No effect	No effect	No effect
K2+K3 (K1 intact)	No effect	No effect	No effect	No effect	No effect	No effect
K1+K3 (K2 intact)	No effect	Effect	Effect	No effect	No effect	Effect
K1+K2+K3 (all silenced)	Effect	Effect	Effect	Effect	Effect	Effect

Directly reproduces real Table 1's pattern: AKT1→K1 and AKT3→K3 each sufficient alone in all 6 lines (via K2+K3 and K1+K2 respectively); AKT2→K2 alone sufficient only in L1/L4/L5 (=A375/WM793/MTG001), insufficient in L2/L3/L6 (=HT144/SK-MEL28/MTG004).

Table 2 (fictionalized) — Cell death, derived from real Table 2, L1 only (=A375)

Condition	Cell death observed?
Positive control (cytotoxic drug)	Yes — gradual increase
Negative control	No
K1+K2+K3 (triple knockdown)	Yes — dramatic increase
K1+K2+K3 + reintroduced K1 (rescue)	No — rescued

Directly reproduces real Table 2's pattern (staurosporine → generic positive control, siCtrl → negative control, siAKT1-3 → K1+K2+K3, mouse Akt1 rescue → reintroduced K1).

Illustrative numeric layer added for the benchmark

Not present in the real paper — the real figure gives only significance (effect/no effect), not exact percentages. These values were constructed to be consistent with the effect/no-effect pattern above, and are what actually went into project_planck_kinase_prompt.md .

Condition	L1	L2	L3	L4	L5	L6
K1+K3 (K2 intact) — proliferation % / death-marker	98% / 0.12	45% / 0.22	52% / 0.18	95% / 0.10	101% / 0.15	40% / 0.25
K1+K2+K3 (triple) — proliferation % / death-marker	8% / 0.82	5% / 0.91	6% / 0.88	9% / 0.79	7% / 0.85	4% / 0.93
