

Drug Comparison Table — PMID 37931033

Genetic Silencing of AKT Induces Melanoma Cell Death via mTOR Suppression (Mol Cancer Ther 2024;23(3):301-315)

AKT-targeted compounds

Compound	Target	Mechanism	IC50 (AKT1)	IC50 (AKT2)	IC50 (AKT3)
MK2206	AKT1/2/3	Allosteric inhibitor	8 nM	12 nM	65 nM
GDC-0068 (ipatasertib)	AKT1/2/3	ATP-competitive inhibitor	5 nM	18 nM	8 nM
INY-03-041	AKT1/2/3	PROTAC (degrader)	~77% total AKT protein reduction at 1µM (vs. ~89% for siAKT1-3) — no per-isoform IC50 reported		

PI3K comparator compound

Compound	Target	Mechanism	IC50 (p110α)	IC50 (p110β)	IC50 (p110γ)	IC50 (p110δ)
GDC-0941 (pictilisib)	PI3K class I	Pan-Class I inhibitor	3 nM	33 nM	75 nM	3 nM

GDC-0941 targets PI3K (upstream of AKT), not AKT itself — included in Supplementary Figure S1 as a comparator, not an AKT-targeted compound. Full mechanism detail and sourcing: see drug_info_table.md in this same folder.
